

Proclaiming Evidence for Truth

THIS WEEK'S CREATION MOMENT

Could You Spend Winter Outside?

"These wait all upon thee; that thou mayest give them their meat in due season. That thou givest them they gather: thou openest thine hand, they are filled with good." - Psalm 104:27-28

Popular science magazines and school textbooks have, for more than a century

now, repeated the theme that mankind evolved from the animal kingdom. Have you ever stopped to think what this means?

Those of us who live where the winters are very cold know fully well that human beings could not survive outside as the animals do. We need the protection of clothes and shelter, but the Creator has provided for the winter needs of the animal kingdom. Dogs for example, if living outside, develop a thicker coat in winter. Does human body hair become thicker under cold conditions? Not at all.

Many animals store fat to carry them through the winter, and their metabolic rate slows down so that they require less food. The fat they store and their metabolism are carefully coordinated and are often very different even between males and females of the same species. The bottom line is that the animals survive the winter and finish up in the springtime looking sleek and trim. Just the reverse usually happens in the case of man. We tend to eat more in winter, and in springtime often have the waistline to show for it!

If human beings had evolved from animals, we would expect a much greater similarity between how animals and humans cope with winter. No, human beings never have been part of the animal kingdom.
